

(12) **United States Patent**
Stuntebeck et al.

(10) **Patent No.:** **US 9,325,713 B2**
(45) **Date of Patent:** **Apr. 26, 2016**

(54) **SYSTEMS AND METHODS FOR CONTROLLING EMAIL ACCESS**

(71) Applicant: **AirWatch, LLC**, Atlanta, GA (US)

(72) Inventors: **Erich Stuntebeck**, Marietta, GA (US);
David Dabbieri, Atlanta, GA (US)

(73) Assignee: **AirWatch LLC**, Atlanta, GA (US)

(*) Notice: Subject to any disclaimer, the term of this patent is extended or adjusted under 35 U.S.C. 154(b) by 0 days.

(21) Appl. No.: **14/272,224**

(22) Filed: **May 7, 2014**

SYSTEMS AND METHODS FOR CONTROLLING EMAIL ACCESS

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is a continuation of application Ser. No. 13/740,606 filed on Jan. 14, 2013, entitled "SYSTEMS AND METHODS FOR CONTROLLING EMAIL ACCESS," which is a continuation-in-part of application Ser. No. 13/706,499 filed on Dec. 6, 2012, entitled "SYSTEMS AND METHODS FOR CONTROLLING EMAIL ACCESS," the entire disclosures of which are hereby incorporated by reference, for all purposes, as if fully set forth herein.

FIELD OF THE INVENTION

Embodiments of the disclosure relate generally to data security, and more particularly, to systems and methods for controlling email access.

BACKGROUND

Controlling email access is critical to ensure that email resources may only be accessed by authorized parties in authorized manners. To date, enterprises have utilized access credentials to control which, if any, parties may access email resources. This method may ensure that only authorized parties may access email resources. However, this method fails to limit access to email resources that satisfy enterprise security standards, fails to modify email resources in accordance with enterprise security standards, and fails to control the manner in which the email resources are accessed by proper recipients. As enterprises seek to protect sensitive information, systems and methods for controlling email access are necessary to ensure that email resources may only be accessed by authorized parties in authorized manners.

BRIEF SUMMARY

Some or all of the above needs and/or problems may be addressed by certain embodiments of the disclosure. Certain embodiments may include systems and methods for controlling access to networks. According to one embodiment of the disclosure, there is disclosed a system. The system can include at least one client device. The system can also include at least one email service. The system can further include at least one memory that stores computer-executable instructions. The system can yet further include at least one processor configured to access the at least one memory. The processor is configured to execute the computer-executable instructions to perform a method including the steps of proxying at least one email resource in transit to the client device from the email service, identifying at least one resource rule associated with the email resources, and adding at least one URL to the email resources in accordance with the resource rules.

According to another embodiment of the disclosure, there is disclosed a method. The method can include identifying at least one email resource on at least one client device, identifying at least one resource rule associated with the email resources, and adding at least one URL to the email resources in accordance with the resource rules.

Further, according to another embodiment of the disclosure, there is disclosed a non-transitory computer-readable medium embodying a program executable in a computing device, the program comprising code that, when executed by

2

a computing device, causes the computing device to perform a method comprising the steps of identifying at least one email resource, identifying at least one resource rule associated with the email resource, and adding at least one URL to the email resources in accordance with the resource rules.

Moreover, according to another embodiment of the disclosure, there is disclosed a method. The method can include identifying at least one email resource, identifying at least one resource rule associated with the email resources, and adding at least one component to the email resources in accordance with the resource rules.

Other embodiments, systems, methods, apparatus aspects, and features of the disclosure will become apparent to those skilled in the art from the following detailed description, the accompanying drawings, and the appended claims.

BRIEF DESCRIPTION OF THE DRAWINGS

The detailed description is set forth with reference to the accompanying drawings, which are not necessarily drawn to scale. The use of the same reference numbers in different figures indicates similar or identical items.

FIG. 1 illustrates a block diagram of a networked environment according to certain embodiments of the disclosure.

FIG. 2 illustrates a flow diagram of exemplary functionality performed by an access control service executed by an access control server in the networked environment of FIG. 1 according to certain embodiments of the present disclosure.

FIG. 3 illustrates a flow diagram of exemplary functionality performed by a client side application executed by a client device in the networked environment of FIG. 1 according to certain embodiments of the present disclosure.

FIGS. 4-5 are exemplary user interfaces rendered by an access control service executed by an access control server in the networked environment of FIG. 1 according to certain embodiments of the present disclosure.

FIGS. 6-11 are exemplary user interfaces rendered by a client side application executed by a client device in the networked environment of FIG. 1 according to certain embodiments of the present disclosure.

FIG. 12 illustrates a block diagram of a networked environment according to certain embodiments of the disclosure.

FIG. 13 illustrates a flow diagram of exemplary functionality performed by an access control service executed by an access control server in the networked environment of FIG. 12 according to certain embodiments of the present disclosure.

FIG. 14 illustrates a block diagram of a networked environment according to certain embodiments of the disclosure.

FIG. 15 illustrates a flow diagram of exemplary functionality performed by a client side application executed by a client device in the networked environments of FIGS. 12 and 14 according to certain embodiments of the present disclosure.

FIG. 16 illustrates a flow diagram of exemplary functionality performed in the networked environments of FIGS. 12 and 14 according to certain embodiments of the present disclosure.

FIG. 17 illustrates schematic block diagrams of an access control server and a client device employed in the network environments of FIGS. 1, 12 and 14 according to certain embodiments of the disclosure.

DETAILED DESCRIPTION

Illustrative embodiments of the disclosure will now be described more fully hereinafter with reference to the accom-

panying drawings, in which some, but not all embodiments of the disclosure are shown. The disclosure may be embodied in many different forms and should not be construed as limited to the embodiments set forth herein; rather, these embodiments are provided so that this disclosure will satisfy applicable legal requirements. As noted above, like numbers refer to like elements throughout.

Illustrative embodiments of the disclosure are directed to, among other things, controlling access to email. As an overview, access to email may be controlled by limiting access of proper recipients to specific email resources and by limiting the manner in which the proper recipients access the specific email resources. In certain embodiments, the email resources may be modified to satisfy access restrictions.

The technical effects of certain embodiments of the disclosure may include preventing unauthorized access to email resources and eliminating costs associated with sensitive information loss. Moreover, the technical effects of certain embodiments of the invention may include modifying email resources to satisfy access restrictions.

FIG. 1 depicts certain illustrative components for a networked environment 100 according to various embodiments. In certain embodiments, the networked environment 100 may include a network 110, a client device 120, and an access control server 150. In some embodiments, the network 110 may be or include, for example, any type of wireless network such as a wireless local area network (WLAN), a wireless wide area network (WWAN), and/or the like. Additionally, the network 110 may be or include the Internet, intranets, extranets, microwave networks, satellite communications, cellular systems, PCS, infrared communications, global area networks, and/or any combination of two or more such networks. In one embodiment, the network 110 facilitates access to email resources 165 for at least one client device 120, where access to the email resources 165 is controlled by an access control server 150.

The client device 120 may comprise, for example, a cellular telephone, a smartphone and/or personal digital assistant, a tablet computer and/or web pad, a laptop computer, a desktop computer, a set-top box, a music player, a game console, and/or another device with like capability. For purposes of convenience, the client device 120 is referred to herein in the singular. Even though the client device 120 is referred to in the singular, it is understood that at least one client device 120 may be employed in the arrangements as described herein.

The client device 120 may include a wired network connectivity component (not shown in FIG. 1), for example, an Ethernet network adapter, a modem, and/or the like. The client device 120 may further include a wireless network connectivity interface (not shown in FIG. 1), for example, a PCI (Peripheral Component Interconnect) card, USB (Universal Serial Bus) interface, PCMCIA (Personal Computer Memory Card International Association) card, SDIO (Secure Digital Input-Output) card, NewCard, Cardbus, a modem, a wireless radio transceiver, and/or the like. The client device 120 may be operable to communicate via wired connection with the access control server 150 with the aid of the wired network connectivity component. The client device 120 may be further operable to communicate wirelessly with the access control server 150 with the aid of the wireless network connectivity component.

The client device 120 may comprise a memory for storing data and applications, a processor for executing applications stored in memory, a display 136 upon which the processor may execute at least one user interface 137, and a local interface such as a bus, as will be described with respect to FIG. 12. The memory of the client device 120 may comprise a data

store 122. The data store 122 of the client device 120 may include a device profile 123. In one embodiment, the device profile 123 may represent hardware, software, and security attributes that describe the state of the client device 120. For instance, the device profile 123 may represent hardware specifications of the client device 120, version and configuration information of various software programs and hardware components installed on the client device 120, transport protocols enabled on the client device 120, version and usage information of various other resources stored on the client device 120, and/or any other attributes associated with the state of the client device 120. In another embodiment, the device profile 123 may further include characteristics describing the state of the client device 120, including indications of the location of the client device 120, the current time associated with the client device 120, the client device's 120 detection of at least one network beacon associated with at least one network 110, and the signal strength of the network beacons received by the client device 120. In yet another embodiment, the device profile 123 may include data indicating a date of a last virus scan of the client device 120, a date of a last access and/or service by an Information Technology (IT) representative, a date of a last access by an access control service 174, and/or any other data indicating a date of last maintenance of the client device 120.

Additionally, the data store 122 of the client device 120 may include at least one user identifier 132. The user identifiers 132 may uniquely identify the user of the client device 120. In one embodiment, the user identifiers 132 may include a username, a password, and/or biometric data related to facial recognition, retina recognition, fingerprint recognition, and the like. Similarly, the data store 122 of the client device 120 may include at least one device identifier 135. The device identifiers 132 may uniquely identify the client device 120. In one embodiment, the device identifiers 135 may be a unique hardware identifier such as a GUID (Globally Unique Identifier), UUID (Universally Unique Identifier), UDID (Unique Device Identifier), serial number, IMEI (Internationally Mobile Equipment Identity), Wi-Fi MAC (Media Access Control) address, Bluetooth MAC address, a CPU ID, and/or the like, or any combination of two or more such hardware identifiers. In another embodiment, the device identifier 135 may be a unique software identifier such a token or certificate, based at least in part on the aforementioned unique hardware identifiers.

The client device 120 may be configured to execute various applications. For example, the client device 120 may be configured to execute applications such as secure container applications, web browsing applications, email applications, instant messaging applications, word processing applications and/or other applications capable of receiving and/or rendering resources 165 on a display 136 associated with the client device 120. Any application capable of receiving and/or rendering resources 165 on a display 136 of the client device 120 is generally referred to herein as a "client side application" 126. The client side application 126 may be stored in the memory of the client device 120. In one embodiment, the client side application 126 may be a secure container application that may be authorized to receive and render resources 165 in accordance with at least one resource rule 171, as described herein. The client side application 126 may include a cryptographic key to decrypt email resources 165 encrypted with a cryptographic key in order to prevent unauthorized access to the email resources 165. For instance, the client side application 126 may have a cryptographic key that may be capable of decrypting email resources 165 transmitted in an

5

encrypted format to the client device 120 by an access control service 174 executed by an access control server 150.

The client side application 126 may be executed to transmit at least one request 177 to access at least one email resource 165. In certain embodiments, the client side application 126 may transmit requests 177 to an access control service 174. In some embodiments, the requests 177 may include a listing of specific email resources 165 the client device 120 seeks to access. In other embodiments, the requests 177 may include an indication that the client device 120 seeks access to email resources 165 associated with the client device 120, such as email resources 165 addressed to the user of the client device 120. In any instance, the requests 177 may include data from the data store 122 of the client device 120 that may assist an access control service 174 in determining whether the client device 120 is authorized to access the email resources 165. In one embodiment, the request 177 may include the device profile 123 associated with the client device 120. In another embodiment, the request 177 may include user identifiers 132 associated with the client device 120. In yet another embodiment, the request 177 may include device identifiers 135 associated with the client device 120.

The client side application 126 may be further executed to receive an indication that the client device 120 is authorized to access the email resources 165. In certain embodiments, the client side application 126 may receive an authorization indication from an access control service 174 executed by an access control server 150. In some embodiments, the authorization indication may specify which, if any, email resources 165 that the client device 120 is authorized to access and may specify the manner in which the client device 120 may access such email resources 165. In one embodiment, the authorization indication may specify that the client device 120 is authorized to access the email resources 165 while the client device 120 is located within at least one authorized location. In another embodiment, the authorization indication may specify that the client device 120 is authorized to access the email resources 165 while the current time associated with the client device 120 is within at least one authorized window. In yet another embodiment, the authorization indication may specify that the client device 120 is authorized to access the email resources 165 while the client device 120 is communicatively connected to at least one network 110 and/or at least one network beacon associated with the network 110, as described in application Ser. No. 13/656,046 entitled "SYSTEMS AND METHODS FOR CONTROLLING NETWORK ACCESS," which is incorporated herein by reference in the entirety.

The client side application 126 may be further executed to receive at least one email resource 165. In certain embodiments, the client side application 126 may receive email resources 165 from an access control service 174 executed by an access control server 150. In some embodiments, the client side application 126 may receive email resources 165 from an enterprise email service, such as Microsoft Exchange, Lotus Notes, Novell Groupwise, Zimbra, or the like. In other embodiments, the client side application 126 may receive email resources 165 from a distribution service executed by a distribution server, as described in application Ser. Nos. 13/396,356 and 13/623,627 both entitled "CONTROLLING DISTRIBUTION OF RESOURCES ON A NETWORK," which are incorporated herein by reference in their entirety.

In any instance, the email resources 165 may include various types of electronic data, such as email messages and email attachments. In certain embodiments, the email messages may include text and/or formatting in email headers, email sender fields, email recipient fields, email subject

6

fields, email bodies, email signatures, and/or email footers. Additionally, the email attachments may include settings-type attachments, applications-type attachments, and content-type attachments. In one embodiment, settings-type attachments may include hardware settings, software settings, and/or the like that configure the functionality provided by the client device 120. In another embodiment, application-type attachments may include book applications, business applications, catalogue applications, education applications, entertainment applications, finance applications, food and drink applications, games applications, health and fitness applications, lifestyle applications, medical applications, music applications, navigation applications, news applications, newsstand applications, photo and video applications, productivity applications, reference applications, social networking applications, sports applications, travel applications, utility applications, weather applications, and/or the like. In yet another embodiment, content-type attachments may include application content, video content, image content, audio content, text content, word processor content, presentation content, spreadsheet content, database content, compressed folder content, disk image content, encrypted content, backup content, web content, page layout content, plug-in content, font content, system content, developer content, data content and/or the like.

The client side application 126 may be similarly executed to receive at least one resource rule 171 associated with the email resources 165. In certain embodiments, the resource rules 171 may regulate user of and/or access to the email resources 165. In some embodiments, the resource rules 171 may include format rules, content rules, attachment rules, and/or access rules. In one embodiment, the format-type resource rules 171 may specify at least one of required, permitted, and/or prohibited formats of the email resources 165. For example, a format-type resource rule 171 may specify that all email resources 165 must be encrypted with AES-256 bit encryption. In another embodiment, the content-type resource rules 171 may specify at least one of required, permitted, and/or prohibited content of the email resources 165. For instance, a content-type resource rule 171 may specify that any email resources 165 containing the text "confidential" must be transmitted utilizing a secure transmission protocol, such as the HTTPS/SSL transmission protocol. In yet another embodiment, the attachment-type resource rules 171 may specify at least one of required, permitted, and/or prohibited attachments to the email resources 165. For example, an attachment-type resource rule 171 may specify that attachments to the email resources 165 must be stripped from the email resources 165. In yet a further embodiment, the access-type resource rules 171 may specify at least one of required, permitted, and/or prohibited access to the email resources 165. For instance, an access-type resource rule 171 may specify that the email resources 165 must be configured to be exclusively accessible via a secure container application, such as the client side application 126. Furthermore, the various types of resource rules 171 may be combined to establish granular access rights. For example, a combination of resource rules 171 may specify required attachment format, attachment content, and attachment access.

In some embodiments, the resource rules 171 may be meta-data and/or other indications that describe the email resources 165. In particular, the resource rules 171 may specify categories/sub-categories to which the email resources 165 belong, that the email resources 165 are considered favorites, the ownership of the email resources 165, the managing party of the email resources 165, that the email resources 165 are confidential, that the email resources 165 are password pro-

7

tected, the historical version of the email resources 165, at least one description of the email resources 165, at least one comment regarding the email resources 165, the size and format of the email resources 165, the download priority associated with the email resources 165, an expiration date associated with the email resources 165, at least one effective date associated with the email resources 165, and/or the like.

In other embodiments, the resource rules 171 associated with the email resources 165 may change based on the state of the client device 120. In certain embodiments, the stringency of the resource rules 171 may be increased, reduced, and/or eliminated based on the state of the client device 120. In one embodiment, the stringency of the resource rules 171 may be increased, reduced, and/or eliminated if the client device 120 is located within the transmission range of certain network beacons and/or certain networks 110 associated with such network beacons. In another embodiment, the stringency of the resource rules 171 may be increased, reduced, and/or eliminated if the client device 120 is located within at least one location. In yet another embodiment, the stringency of the resource rules 171 may be increased, reduced, and/or eliminated if the current time associated with the client device 120 is within at least one time window. In yet a further embodiment, the stringency of the resource rules 171 may be increased, reduced, and/or eliminated if the client device 120 has previously satisfied the resource rules 171.

Additionally, the client side application 126 may be executed to determine whether the client device 120 is authorized to access the email resources 165. In certain embodiments, the client side application 126 may determine whether the resource rules 171 associated with the email resources 165 are satisfied by the email resources 165. For instance, the client side application 126 may determine that the client device 120 is authorized to access the email resources 165 if the attachments to the email resources 165 have been stripped from the email resources 165 in accordance with the resource rules 171 associated with the email resources 165, which specify that the email resources 165 may not have attachments. In some embodiments, the client side application 126 may determine whether the client device is authorized based at least in part on at least one of the device profile 123, user identifiers 132, or device identifiers 135.

The client side application 126 may be further executed to modify the email resources 165. In certain embodiments, the client side application 126 may modify the email resources 165 in response to a determination that the email resources 165 do not satisfy the resource rules 171 associated with the email resources 165. In particular, the client side application 126 may modify the email resources 165 so that the email resources 165 satisfy the resource rules 171 associated with the email resources 165. In some embodiments, the client side application 126 may modify at least one portion of the email resources 165. In other embodiments, the client side application 126 may modify all portions of and/or the entirety of the email resources 165.

In any instance, the client side application 126 may modify the email resources 165 by formatting, encoding, configuring, adding, removing, stripping, moving, replacing and/or flagging portions of the email resources. In one embodiment, the client side application 126 may modify the email resources 165 by formatting the email resources 165 into Hypertext Markup Language (HTML), Rich Text, Plain Text, and/or other formats. In another embodiment, the client side application 126 may modify the email resources 165 by encoding the email resources 165 using Advanced Encryption Standard (AES), Data Encryption Standard (DES), and/or other encryption protocols. In yet another embodiment, the

8

client side application 126 may modify the email resources 165 by configuring the email resources 165 to be exclusively accessible via at least one secure container application, such as the client side application 126. In yet a further embodiment, the client side application 126 may modify the email resources 165 by adding portions to and/or removing portions from the email resources 165, for instance, by adding or removing an email signature.

Additionally, in an exemplary embodiment, the client side application 126 may modify the email resources 165 by removing portions of the email resources 165 and configuring the removed portions of the email resources 165 to be exclusively accessible via a secure container application, such as the client side application 126. For example, the client side application 126 may remove attachments from the email resources 165 and may encrypt the removed attachments based at least in part on at least one cryptographic key accessible to the client side application 126. In another embodiment, the client side application 126 may modify the email resources 165 by performing at least one of decrypting the email resources 165, re-encrypting the email resources 165, cryptographically signing email resources 165, or re-signing email resources 165. In yet another embodiment, the client side application 126 may modify the email resources 165 by moving certain portions of the email resources 165, such as by moving a photograph from the body of the email resources 165 to the attachments of the email resources 165. In yet a further embodiment, the client side application 126 may modify the email resources 165 by replacing certain portions of the email resources 165, such as replacing misspelled text with the properly spelled text. In even yet a further embodiment, the client side application 126 may modify the email resources 165 by flagging the email resources 165 as having been modified, such as by attaching an indication to the email resources 165 that provides information related to the modification of the email resources 165.

The client side application 126 may be yet further executed to access at least one email resource 165. In certain embodiments, the client side application 126 may access the email resources 165 received from an access control service 174 and/or another distribution service. In some embodiments, the client side application 126 may access the email resources 165 on the client device 120 in accordance with the resource rules 171. For example, the client side application 126 may determine that the email resources 165 may not be accessed by the client device 120 because the client device 120 is not located within an authorized location specified by the resource rules 171 associated with the email resources 165.

In any instance, the client side application 126 may access the email resources 165 on the client device 120 by storing, installing, activating, rendering and/or executing the email resources 165 on the client device 120. In one embodiment, the client side application 126 may store the email resources 165 on the client device 120 by placing the email resources 165 in the data store 122 of the client device 120. In another embodiment, the client side application 126 may install the email resources 165 on the client device 120 by placing the email resources 165 in the data store 122 of the client device 120 and by disabling and/or removing any files that conflict with the email resources 165. In yet another embodiment, the client side application 126 may activate the email resources 165 on the client device 120 by placing the email resources 165 in the data store 122 of the client device 120, by disabling and/or removing any files that conflict with the email resources 165, and by instructing the client device 120 to conform its operations to the email resources 165. Additionally, the client side application 126 may call on other appli-

cations and/or services accessible to the client device 120 that are associated with the email resources 165.

In yet a further embodiment, the client side application 126 may render the email resources 165 on the client device 120 by presenting the email resources 165 in a user interface 137 executed on the display 136 of the client device 120. In particular, the client side application 126 may render the email resources 165 in a user interface 137 by decompressing compressed files and presenting the uncompressed files, mounting disk image files and presenting the mounted image files, running executable files and presenting the executed files, by enabling a data search of the email resources 165 and presenting the featured output in a user interface 137, by calling on another application on the client device 120 to respond to data links contained within the email resources 165, and/or by transmitting a part or the whole of the email resources 165 to another application on the client device 120. The client side application 126 may render a single email resource 165 or a series of email resources 165 in a comprehensive manner, such as presenting image files in a slide-show-style presentation, and may further render an environment that displays an array of email resources 165 in a single view, such as a category-based tree or outline format. Additionally, in an exemplary embodiment, the client side application 126 may execute the email resources 165 by placing the email resources 165 in the data store 122 of the client device 120, by disabling and/or removing any files that conflict with the email resources 165, and by instructing the client device 120 to perform the operations of the email resources 165.

In certain embodiments, the client side application 126 may be a secure container application that is configured to protect the email resources 165 from unauthorized access. In some embodiments, the client side application 126 may be configured to protect email resources 165 that have been received from an access control service 174. In one embodiment, the client side application 126 may be executed to enforce the resource rules 171 and/or other metadata associated with the email resources 165. For instance, the client side application 126 may prohibit cutting, copying, pasting, transmitting, emailing, text messaging, screen capturing, and/or otherwise manipulating the email resources 165 while the email resources 165 are accessed by the client side application 126. In another embodiment, the client side application 126 may prohibit other applications on the client device 120 and/or other services accessible to the client device 120 from accessing the email resources 165. In particular, the client side application 126 may monitor the data stream between the network 110 and the client device 120, may block any access attempts by another application and/or service, may proxy the email resources 165, and may present the proxied email resources 165 in a user interface 137 rendered by the client side application 126.

The access control server 150 may comprise, for example, a server computer or any other system providing access control capability. Alternatively, a plurality of access control servers 150 may be employed that are arranged, for example, in at least one server bank, computer bank or other arrangement. For example, a plurality of access control servers 150 together may comprise a cloud computing resource, a grid computing resource, and/or any other distributed computing arrangement. Such access control servers 150 may be located in a single installation or may be distributed among many different geographic locations. For purposes of convenience, the access control server 150 is referred to herein in the singular. Even though the access control server 150 is referred

to in the singular, it is understood that a plurality of access control servers 150 may be employed in the arrangements as described herein.

The access control server 150 may comprise a memory for storing data and applications and a processor for executing applications stored in memory, as will be described with respect to FIG. 17. The memory of the access control server 150 may comprise a data store 153. The data store 153 may be representative of at least one data store. The data store 153 may contain certain data that is accessible to the access control server 150. In particular, the data store 153 may contain at least one email resource 165 and at least one resource rule 171 associated with the email resources 165, as described herein. The data in the data store 153 may be associated with the operation of certain applications and/or functionalities executed by the access control server 150. The data store 153 may utilize strong encryption standards to protect the email resources 165 from unauthorized access. For example, the data store 153 may utilize AES (Advanced Encryption Standard) or a similar strong encryption standard commonly utilized for server-side data storage.

The access control server 150 may execute certain applications and/or functionalities such as the access control service 174, as well as other applications, services, processes, systems, engines, or functionality not disclosed in detail herein. The access control service 174 may be executed to control email access. In particular, the access control service 174 may limit access to at least one email resource 165 to at least one client device 120 that is authorized to access the email resources 165. The access control service 174 may be further executed to modify at least one email resource 165 so that the email resources 165 satisfy at least one resource rule 171 associated with the email resources 165. The access control service 174 may yet be further executed to distribute at least one email resource 165 to at least one client device 120 that is authorized to access the email resources 165.

The access control service 174 may be executed to control access to at least one email resource 165. In certain embodiments, the access control service 174 may be executed to determine whether at least one client device 120 is authorized to access the email resources 165. In some embodiments, the client side application 126 may determine whether the resource rules 171 associated with the email resources 165 are satisfied by the email resources 165. For instance, the access control service 174 may determine that a client device 120 is authorized to access the email resources 165 if the attachments to the email resources 165 have been stripped from the email resources 165 in accordance with the resource rules 171, which specify that the email resources 165 may not have attachments. In other embodiments, the access control service 174 may determine whether the client device is authorized based at least in part on at least one of the device profile 123, user identifiers 132, or device identifiers 135.

The access control service 174 may be further executed to modify the email resources 165 to satisfy the resource rules 171 associated with the email resources 165. In certain embodiments, the access control service 174 may modify the email resources 165 in response to a determination that the email resources 165 do not satisfy the resource rules 171 associated with the email resources 165. In particular, the access control service 174 may modify the email resources 165 so that the email resources 165 satisfy the resource rules 171 associated with the email resources 165. In some embodiments, the access control service 174 may modify at least one portion of the email resources 165. In other embodiments, the access control service 174 may modify all portions of and/or the entirety of the email resources 165.

11

In any instance, the access control service 174 may modify the email resources 165 by formatting, encoding, configuring, adding, removing, stripping, moving, replacing or flagging portions of the email resources. In one embodiment, the access control service 174 may modify the email resources 165 by formatting the email resources 165 into Hypertext Markup Language (HTML), Rich Text, Plain Text, and/or other formats. In another embodiment, the access control service 174 may modify the email resources 165 by encoding the email resources 165 using Advanced Encryption Standard (AES), Data Encryption Standard (DES), and/or other encryption protocols. In yet another embodiment, the access control service 174 may modify the email resources 165 by configuring the email resources 165 to be exclusively accessible via at least one secure container application, such as a client side application 126. In yet a further embodiment, the access control service 174 may modify the email resources 165 by adding portions to and/or removing portions from the email resources 165, for instance, by adding or removing an email signature.

Additionally, in an exemplary embodiment, the access control service 174 may modify the email resources 165 by removing portions from the email resources 165 and configuring the removed portions of the email resources 165 to be exclusively accessible via a secure container application, such as the client side application 126. For example, the access control service 174 may remove attachments to the email resources 165 from the email resources 165, may encrypt the removed attachments based at least in part on at least one cryptographic key, and may make the removed attachments and cryptographic keys accessible to the client side application 126. In another embodiment, the access control service 174 may modify the email resources 165 by performing at least one of decrypting the email resources 165, re-encrypting the email resources 165, cryptographically signing email resources 165, or re-signing email resources 165. In yet another embodiment, the access control service 174 may modify the email resources 165 by moving certain portions of the email resources 165, such as by moving a photograph from the body of the email resources 165 to the attachments of the email resources 165. In yet a further embodiment, the access control service 174 may modify the email resources 165 by replacing certain portions of the email resources 165, such as replacing misspelled text with the properly spelled text. In even yet a further embodiment, the access control service 174 may modify the email resources 165 by flagging the email resources 165 as having been modified, such as attaching an indication to the email resources 165 that provides information related to the modification of the email resources 165.

The access control service 174 may be yet further executed to transmit at least one email resource 165 to at least one client device 120. In certain embodiments, the access control service 174 may transmit the email resources 165 to the client devices 120 responsive to a determination that the client devices 120 are authorized to access the email resources 165. In some embodiments, the access control service 174 may transmit the email resources 165 to the client devices 120 responsive to modifying the email resources 165 to satisfy the resource rules 171 associated with the email resources 165. In one embodiment, the access control service 174 may directly transmit the email resources 165 to a client side application 126 executed by the client devices 120. In another embodiment, the distribution service 174 may make the email resources 165 available for download by the client devices 120 and may transmit the email resources 165 to the client devices 120 upon receiving requests 177 to download the

12

email resources 165 from the client devices 120. In any instance, the access control service 174 may establish a communicative connection with the client devices 120 by utilizing a secure transmission protocol, such as HTTPS/SSL, before transmitting the email resources 165 to the client devices 120.

FIG. 2 is a flowchart illustrating exemplary functionality performed by an access control service 174 executed by an access control server (FIG. 1) according to certain embodiments. It is understood that the flowchart of FIG. 2 provides merely an example of the many different types of functional arrangements that may be employed to implement the operation of the access control service 174 as described herein. As an alternative, the flowchart of FIG. 2 may be viewed as depicting an example of steps of a method implemented in the access control server 150 according to at least one embodiment.

Beginning with step 203, the access control service 174 may identify at least one email resource 165. In certain embodiments, the access control service 174 may identify at least one email resource 165 associated with at least one client device 120. In one embodiment, the email resources 165 may be associated with the client devices 120 if the email resources 165 are addressed to the client devices 120 and/or the users of the client devices 120. For instance, the email resources 165 may be addressed to the client devices 120 and/or the users of the client devices 120 if the identities of the client devices 120 and/or the users of the client devices 120 are specified within the email headers, email sender fields, email CC fields, email BCC fields, email recipient fields, email subject fields, email bodies, email signatures, and/or email footers of the email resources 165. In another embodiment, the email resources 165 may be associated with the client devices 120 if the email resources 165 are accessible to the client devices 120, for instance, via at least one user identifier, at least one device identifier, and/or at least one device profile associated with the client devices 120. In yet another embodiment, the email resources 165 may be associated with the client devices 120 according to a listing of associated email resources 165 and client devices 120. In any instance, the email resources 165 may include email messages, email attachments, and/or other electronic data, as described herein.

Next, in step 206, the access control service 174 may identify at least one resource rule 171. In certain embodiments, the access control service 174 may identify at least one resource rule 171 associated with at least one email resource 165. In some embodiments, a given resource rule 171 may be associated with at least one email resource 165 and, similarly, a given email resource 165 may be associated with at least one resource rule 171. In one embodiment, the resource rules 171 may be associated with the email resources 165 if the resource rules 171 are embedded within the email headers, email bodies, email signatures, and/or email footers of the email resources 165. In particular, the email resources 165 may include embedded metadata and/or other instructions that represent at least one resource rule 171. In another embodiment, the resource rules 171 may be associated with the email resources 165 if the resource rules 171 are affixed to the email resources 165, such as attachments to the email resources 165. In yet another embodiment, the resource rules 171 may be associated with the email resources 165 according to a listing of associated email resources 165 and resource rules 171. In any instance, the resource rules 171 may regulate access to the email resources 165 associated with the resource rules 171 by the client devices 120 associated with the email resources 165, as described herein.

13

Then, in step 209, the access control service 174 may determine whether the email resources 165 satisfy the resource rules 171 associated with the email resources 165. In certain embodiments, the access control service 174 may determine that the client devices 120 associated with the email resources 165 are authorized to access the email resources 165 if the email resources 165 satisfy the associated resource rules 171. In any instance, the access control service 174 may determine whether the state of the email resources 165 satisfies the requirements specified by the associated resource rules 171. In particular, the access control service 174 may determine whether the email headers, email sender fields, email CC fields, email BCC fields, email recipient fields, email subject fields, email bodies, email signatures, email footers, and/or email attachments of the email resources 165 satisfy the associated resource rules 171, as described herein.

If the access control service 174 determines that the email resources 165 do not satisfy the resource rules 171, then the access control service 174 may proceed to step 212 and may modify the email resources 165. In certain embodiments, the access control service 174 may modify the email resources 165 so that the email resources 165 satisfy the resource rules 171 associated with the email resources 165. In some embodiments, the access control service 174 may modify at least one portion of the email resources 165. In other embodiments, the access control service 174 may modify all portions of and/or the entirety of the email resources 165. In any instance, the access control service 174 may modify the email resources 165 by formatting, encoding, configuring, adding, removing, stripping, moving, replacing and/or flagging portions of the email resources 165, as described herein.

On the contrary, if the access control service 174 determines that the email resources 165 satisfy the resource rules 171, then the access control service 174 may proceed to step 215 and may authorize the client devices 120 to access the email resources 165. In certain embodiments, the access control service 174 may authorize the client devices 120 to access the email resources 165 by transmitting the email resources 165 to at least one client side application 126 executed by the client devices 120. In some embodiments, the access control service 174 may authorize the client devices 120 to access the email resources 165 by notifying the client devices 120 that the email resources 165 may be downloaded from the access control service 174 and may further transmit the email resources 165 to the client devices 120 upon a request 177. In any instance, the access control service 174 may authorize the client devices 120 to access the email resources 165 by providing the client devices 120 with a means of accessing the email resources 165. In one embodiment, the access control service 174 may authorize the client devices 120 to access at least one unmodified email resource 165. In another embodiment, the access control service 174 may authorize the client devices 120 to access at least one email resource 165 that has been modified by the access control service 174 so that the email resources 165 satisfy the resource rules 171 associated with the email resources 165.

FIG. 3 is a flowchart illustrating exemplary functionality performed by a client side application 126 executed by a client device 120 (FIG. 1) according to certain embodiments. It is understood that the flowchart of FIG. 3 provides merely an example of the many different types of functional arrangements that may be employed to implement the operation of the client side application 126 as described herein. As an alternative, the flowchart of FIG. 3 may be viewed as depicting an example of steps of a method implemented in the client device 120 according to at least one embodiment.

14

Beginning with step 303, the client side application 126 may transmit at least one request 177 to access at least one email resource 165. In certain embodiments, the client side application 126 may transmit requests 177 to an access control service 174. In some embodiments, the requests 177 may include a listing of specific email resources 165 that the client device 120 seeks to access. In other embodiments, the requests 177 may include an indication that the client device 120 seeks access to email resources 165 associated with the client device 120, such as email resources 165 addressed to the user of the client device 120. In any instance, the requests 177 may include data from the data store 122 of the client device 120, such as device profiles 123, user identifiers 132, and device identifiers 135 associated with the client device 120, as described herein.

Next, in step 306, the client side application 126 may receive at least one email resource 165. In certain embodiments, the client side application 126 may receive at least one email resource 165 from an access control service 174 executed by an access control server 150. In one embodiment, the client side application 126 may directly receive the email resources 165 from the access control service 174. In another embodiment, the client side application 126 may receive at least one indication from the access control service 174 that specify that the email resources 165 are available for download from the access control service 174. In such embodiment, the client side application 126 may request to download the email resources 165 from the access control service 174 in response to receiving an indication that the email resources 165 are available for download from the access control service 174. In some embodiments, the client side application 126 may receive at least one email resource 165 from an enterprise email service, such as Microsoft Exchange, Lotus Notes, Novell GroupWise, Zimbra and/or other services capable of distributing email resources 165 to client devices 120.

Then, in step 309, the client side application 126 may identify at least one resource rule 171. In certain embodiments, the client side application 126 may identify at least one resource rule 171 associated with at least one email resource 165. In some embodiments, the resource rules 171 may be associated with multiple email resources 165 and the email resources 165 may be associated with multiple resource rules 171, as described herein. In one embodiment, the resource rules 171 may be associated with the email resources 165 if the resource rules 171 are embedded within the email headers, email bodies, email signatures, and/or email footers of the email resources 165. In particular, the email resources 165 may include embedded metadata and/or other instructions that represent at least one resource rule 171. In another embodiment, the resource rules 171 may be associated with the email resources 165 if the resource rules 171 are affixed to the email resources 165, such as attachments to the email resources 165. In yet another embodiment, the resource rules 171 may be associated with the email resources 165 according to a listing of associated email resources 165 and resource rules 171. In any instance, the resource rules 171 may regulate access to the email resources 165 associated with the resource rules 171 by the client devices 120 associated with the email resources 165, as described herein.

Next, in step 312, the client side application 126 may determine whether the email resources 165 satisfy the resource rules 171 associated with the email resources 165. In certain embodiments, the client side application 126 may determine that the client device 120 associated with the email resources 165 is authorized to access the email resources 165 if the email resources 165 satisfy the associated resources

15

rules 171. In any instance, the client side application 126 may determine whether the state of the email resources 165 satisfies the requirements specified by the associated resource rules 171. In particular, the client side application 126 may determine whether the email headers, email sender fields, email CC fields, email BCC fields, email recipient fields, email subject fields, email bodies, email signatures, email footers, and/or email attachments of the email resources 165 satisfy the associated resource rules 171, as described herein.

If the client side application 126 determines that the email resources 165 do not satisfy the resource rules 171, then the client side application 126 may proceed to step 315 and may modify the email resources 165. In certain embodiments, the client side application 126 may modify the email resources 165 so that the email resources 165 satisfy the resource rules 171 associated with the email resources 165. In some embodiments, the client side application 126 may modify at least one portion of the email resources 165. In other embodiments, the access control service 174 may modify all portions of and/or the entirety of the email resources 165. In any instance, the client side application 126 may modify the email resources 165 by formatting, encoding, configuring, adding, removing, stripping, moving, replacing and/or flagging portions of the email resources 165, as described herein.

On the contrary, if the client side application 126 determines that the email resources 165 satisfy the resource rules 171, then the client side application 126 may proceed to step 318 and may authorize the client device 120 to access the email resources 165. In certain embodiments, the client side application 126 may authorize the client device 120 to access the email resources 165 by providing the client devices 120 with a means of accessing the email resources 165. For example, the client side application 126 may enable storing, installing, activating, rendering and/or executing the email resources 165 on the client device 120, as described herein. In one embodiment, the client side application 126 may authorize the client device 120 to access at least one unmodified email resource 165. In another embodiment, the client side application 126 may authorize the client device 120 to access at least one email resource 165 that have been modified by the access control service 174 so that the email resources 165 satisfy the resource rules 171 associated with the email resources 165. In yet another embodiment, the client side application 126 may authorize the client device 120 to access at least one email resource 165 that have been modified by the client side application 126 so that the email resources 165 satisfy the resource rules 171 associated with the email resources 165.

FIG. 4 is an example of a user interface 137a that allows an administrator of an access control service 174 (FIG. 1) to associate at least one resource rule 171 (FIG. 1) with at least one email resource 165 (FIG. 1). In certain embodiments, the user interface 137a may include a grouping view field 402, a rules view field 404, an add rules button 406, at least one rules description field 408, at least one action button 410, and at least one defined rule 412.

The grouping view field 402 may allow the administrator to select a group of client devices 120 and/or a group of users of client devices 120 to manage. For example, the administrator may manipulate the resource rules 171 that apply to the “Enterprise” group of client devices 120 by selecting the “Enterprise” grouping from the pull-down provided by the grouping view field 402. The rules view field 404 may allow the administrator to filter the resource rules 171 to manage. For instance, the administrator may filter the resource rules 171 by either selecting the “All Email Rules” set of resource

16

rules 171 or the “Active Email Rules” set of resource rules 171 from the options provided by the rules view field 404.

The add rules button 406 may allow the administrator to add new resource rules 171 to the collection of resource rules 171 that apply to the “Enterprise” group of client devices 120. For example, invoking the add rules button 406 may instruct the access control service 174 to provide another user interface 137 in which the administrator may define at least one new resource rule 171, as will be described in FIG. 5. The rules description fields 408 may specify at least one characteristic that describe each of the resource rules 171. For instance, the rules description fields 408 may include indications of whether a rule is active 408a, a name of a rule 408b, a storage location of a rule 408c, a brief description of a rule 408d, an assignment of a rule 408e, an effective date and/or expiration date of a rule 408f, and a last modified date of a rule 408g. The action buttons 410 may allow an administrator to take at least one action to a resource rule 171, such as editing the resource rule 171 and/or adjusting the settings of a resource rule 171. The defined rules 412 may include at least one resource rule 171 that have been previously created by an administrator of the access control service 174, such as the “Encrypt Email Attachments” rule 412a and the “Remove Email Attachments” rule 412b.

FIG. 5 is an example of a user interface 137b that allows an administrator of an access control service 174 (FIG. 1) to create at least one new resource rule 171 (FIG. 1), which may provide and/or control access to at least one applications and/or services accessible to at least one client device 120 (FIG. 1). In certain embodiments, the user interface 137b may include a rule type field 502, an access credentials field 504, an access rights field 506, and at least one action button 508. In some embodiments, the access rights field 506 may include an “Encrypt All Attachments” button 506a and a “Remove All Attachments” button 506b.

The rule type field 502 may include one of more types of resource rules 171 that may be created through the user interface 137b. For example, an administrator of the access control service 174 may select “Exchange ActiveSync” from the rules type field 502 to create resource rules 171 associated with email resources 165 (FIG. 1). The access credentials field 504 may include at least one field that accepts input of at least one credential for access to at least one application and/or service accessible to the client devices 120. For instance, an administrator of the access control service 174 may input the “Domain,” “Username,” “Email Address,” “Password,” and “Payload Certificates” associated with the client devices 120. The access rights field 506 may include at least one access right that may be defined for the client devices 120, which may control access by client devices 120 to applications and/or services. For example, an administrator of the access control service 174 may apply at least one access restriction including “Prevent Moving Messages,” “Prevent Use in 3rd Party Apps,” “Disable recent contact sync,” “Encrypt All Attachments” 506a, and “Remove All Attachments” 506b. As a further example, an administrator of the access control service 174 may apply at least one access restriction including “Add URLs,” “Encrypt All URLs,” “Digitally Sign All URLs,” and “Encrypt and Digitally Sign All URLs” (not shown in FIG. 5). The action buttons 508 may include at least one button that saves and/or deletes the resource rules 171 defined in the user interface 137b. For example, an administrator of the access control service 174 may invoke the “Save” action button 508 to store the resource rules 171 associated with the email resources 165 in the data store 153 (FIG. 1) of the access control server 150 (FIG. 1).

17

FIG. 6 is an example of a user interface 137c executed by a client side application 126 (FIG. 1) on a client device 120 (FIG. 1). In certain embodiments, the client side application 126 may be an application native to the client device 120 that is capable of receiving and/or rendering email resources 165. For example, the client side application 126 may be a native email application, such as Microsoft Outlook or Apple Mail. The client side application 126 may include an email selection field 602 and an email viewing pane 604. The email selection field 602 may include at least one email message that may be selected to access within the email viewing pane 604. For example, the user of the client device, such as "John Smith," may select an email message entitled "Confidential—Q3 2012 Revenue" sent to "John Smith" from "George Williams." The email viewing pane 604 may include a sender field, a recipient field, a title field, a body field, and at least one attachment 606. For instance, the email viewing pane 604 may provide a user of a client device 120 with access to the attachment entitled "PROTECTED: Q3 2012 Revenue.pdf." As a further example, the email viewing pane 604 may provide the user of the client device 120 with access to a URL within the email resources 165, such as "SECURE BROWSER: www.enterprisepolicy.com" (not shown in FIG. 6).

FIG. 7 is an example of a user interface 137d executed by a client side application 126 (FIG. 1) on a client device 120 (FIG. 1). In certain embodiments, the client side application 126 may be an application native to the client device 120 that is capable of receiving and/or rendering email resources 165. For example, the client side application 126 may be a native email application, such as Microsoft Outlook or Apple Mail, as similarly described in FIG. 6. In some embodiments, the user of the client device 120 may request to access the attachment entitled "PROTECTED: Q3 2012 Revenue.pdf" by selecting the attachment on the user interface 137d. In other embodiments, the user of the client device 120 may request to access a URL entitled "SECURE BROWSER: www.enterprisepolicy.com" by selecting the URL on the user interface 137d (not shown in FIG. 7). In any instance, the attachment entitled "PROTECTED: Q3 2012 Revenue.pdf" and the URL entitled "SECURE BROWSER: www.enterprisepolicy.com" may be associated with resource rules 171 (FIG. 1) that specify that the email resources 165 may only be accessed via a secure container application.

The user interface 137d may provide an access selection field 702 to provide the user of the client device 120 with at least one access application and/or service that is capable of accessing the email resources 165 in accordance with the associated resource rules 171. For example, the access selection field 702 may specify that a client side application 126 with secure container and/or secure browsing capabilities may be selected, a client side application 126 with native email and/or browsing capabilities may not be selected, and a printing function of the client device 120 may not be selected. By selecting the client side application 126 with secure container and/or browsing capabilities from the access selection field 702, the current client side application 126 with native email capabilities may call on the client side application 126 with secure container and/or browser capabilities in order to access the email resources 165 in accordance with the relevant resource rules 171.

FIG. 8 is an example of a user interface 137e executed by a client side application 126 (FIG. 1) on a client device 120 (FIG. 1). In certain embodiments, the client side application 126 may be a secure container and/or secure browser application that is capable of receiving and/or rendering email resources 165, as described herein. In some embodiments, the

18

user interface 137e may provide an authentication form which must be filled out by the user of the client device 120 in order to gain access to at least one email resource 165 accessible through the secure container and/or secure browser environment of the client side application 126. In particular, the user interface 137e may provide an authentication form that includes a username field 802, a password field 804, and a login button 806. A user of the client device 120, such as "John Smith," may provide a username, such as "John Smith," in the username field 802, may provide a password, such as "...," and may invoke the login button 806 to provide the access credentials to the client side application 126. Responsive to a determination that the access credentials provided by the user of the client device 120 are authorized, the client side application 126 may provide the user of the client device 120 with access to the secure container environment of the client side application 126.

FIG. 9 is an example of a user interface 137f executed by a client side application 126 (FIG. 1) on a client device 120 (FIG. 1). In certain embodiments, the client side application 126 may be a secure container and/or secure browser application that is capable of receiving and/or rendering email resources 165, as described herein. The secure container and/or secure browser environment of the client side application 126 may include a views pane 902, a categories pane 904, and action buttons 906. The views pane 902 may include at least one view that is accessible to the user of the client device 120, such as an "all content" view, a "new content" view, a "recent activity" view, and a "favorites" view. The user of the client device 120 may select one of the available views, each of which may include a subset of email resources 165 related to the certain view. The categories pane 904 may include at least one category of email resources 165 that are available to the user of the client device 120, such as an "Email Attachments" category that is a subset of an "Email Resources" category. Similarly, the categories pane 904 may further include a "URLs" category that is a subset of an "Email Resources" category, which is not shown in FIG. 9. The user of the client device 120 may, for instance, select the "Email Attachments" and/or "URLs" category to access at least one email attachment and/or URL that is configured to be accessible via the secure container and/or secure browser environment of the client side application 126, respectively. The action buttons 906 may include a "Content" button, a "Downloads" button, a "Search" button, an "Updates" button, and a "Settings" button that may launch other user interfaces 137 provided by the client side application 126 to enable additional views, applications, and/or services.

FIG. 10 is an example of a user interface 137e executed by a client side application 126 (FIG. 1) on a client device 120 (FIG. 1). In certain embodiments, the client side application 126 may be a secure container and/or secure browser application that is capable of receiving and/or rendering email resources 165, as described herein. The secure container and/or secure browser environment of the client side application 126 may include an accessible resource listing 1002 and an access notification 1004. The user of the client device 120 may select an email resource 165, such as an email attachment or URL, from the accessible resource listing 1002.

In one embodiment, responsive to the user of the client device 120 selecting the "Q3 2012 Revenue.pdf" email resource 165 from the accessible resource listing 1002, the client side application 126 may provide the user with access to the email resource 165 by unlocking the protected file. In particular, the email resource 165 may have been encrypted with a symmetric cryptographic key and/or an asymmetric cryptographic key by an access control service 174 (FIG. 1).

19

according to at least one resource rule 171 (FIG. 1) associated with the email resource 165, as described herein. Consequently, the client side application 126 may decrypt the email resource 165 to enable access to the email resource 165 and may provide an access notification 1004 that specifies that the client side application 126 is “Unlocking (the) PROTECTED file” and to “Please Wait” to access the email resource 165 while the client side application 126 unlocks the email resource 165.

In another embodiment, responsive to the user of the client device 120 selecting a URL entitled “SECURE BROWSER: www.enterprisepolicy.com” from the accessible resource listing 1002 (not shown in FIG. 10), the client side application 126 may provide the user with access to the email resource 165 within a secure browser application. In particular, if the current client side application 126 determines that it is not a secure browser application, the client side application 126 may prompt the user with an access notification 1004 that states that the current browser is not capable of launching the URL. Upon transmitting a notification to the user that the client side application 126 is not fit to open the URL, the client device 120 may launch a client side application 126 with secure container and/or secure browsing capabilities.

FIG. 11 is an example of a user interface 137e executed by a client side application 126 (FIG. 1) on a client device 120 (FIG. 1). In certain embodiments, the client side application 126 may be a secure container and/or secure browser application that is capable of receiving and/or rendering email resources 165, as described herein. The client side application 126 may include a resource title pane 1102, a resource content pane 1104 and a resource page selection pane 1106. The resource title pane 1102 may specify the title of the email resources 165, such as “Q3 2012 Revenue” and/or “www.enterprisepolicy.com” (not shown in FIG. 11). The resource content pane 1104 may include the body of the email resources 165, such as the pages of the PDF file “Q3 2012 Revenue” or the pages of the website “www.enterprisepolicy.com.” The resource page selection pane 1106 may include at least one page of the email resources 165. The user of the client device 120 may, for example, select a page from the resource page selection pane 1106. Responsive to the user of the client device 120 selecting a certain page from the resource page selection pane 1106, the client side application 126 may navigate to the selected page and present the content of the selected page in the resource content pane 1104.

FIG. 12 depicts certain illustrative components for a networked environment 1200 according to various embodiments. In certain embodiments, the networked environment 1200 may include at least one network 110, at least one client device 120, an access control service 174, and at least one email service 1202. The email services 1202 may be configured to provide the client devices 120 with access to at least one email resource 165 (FIG. 1) associated with the email services 1202. As an example, the email services 1202 may be and/or include at least one enterprise email service, such as Microsoft Exchange, Lotus Notes, Novell GroupWise, Zimbra and/or other services capable of distributing email resources 165 to client devices 120. The access control service 174 may be configured to authorize the client devices 120 to access to the email services 1202, may control the manner in which the client devices 120 are authorized to access the email services 1202, and may provide the client devices 120 with access to the email services 1202.

In one embodiment, the access control service 174 may be configured to proxy email resources 165 provided to the client devices 120 by the email services 1202. The access control service 174 may, for instance, proxy all email resources 165

20

transmitted between the email services 1202 and the client devices 120. More particularly, the networked environment 1200 may be organized so that the access control service 174 is positioned between the email services 1202 and client devices 1202, preventing the email services 1202 and client devices 1202 from communicating directly. Thus, the access control service 174 may proxy email resources 165 in transit to the client devices 120 from the email services 1202. In another embodiment, the access control service 174 may be configured to provide a gateway for access to the email services 1202. The access control service 174 may, for instance, provide authorized client devices 120 with access to the email services 1202 and deny unauthorized client devices 120 from accessing the email services 1202.

In any instance, the access control service 174 may be configured to determine whether the client devices 120 are authorized to access the email resources 165. The access control service 174 may, for example, receive at least one request 177 (FIG. 1) to access the email services 1202 from the client devices 120. The access control service 174 may determine whether the client devices 120 associated with the requests 177 are authorized to access the email services 1202 based on, for instance, at least one device profile 123 (FIG. 1), at least one user identifier 132 (FIG. 1), at least one device identifier 135 (FIG. 1) associated with the client device 120, which may be included in the requests 177. The access control service 174 may provide the client devices 120 with access to the email services 1202 in response to a determination that the client devices 120 are authorized to access the email services 1202. In one embodiment, the access control service 174 may establish a communicative connection between the email services 1202 and the client devices 120, which may facilitate the transmission of email resources 165 between the email services 1202 and the client devices 120. In another embodiment, the access control service 174 may establish a communicative connection between the access control service 174 and the client devices 120, which may facilitate the transmission of email resources 165 associated with the email service 1202 between the access control service 174 and the client devices 120.

Additionally, the access control service 174 may be configured to control access to the email resources 165 by the client devices 120. The access control service 174 may determine which email resources 165 the client devices 120 are authorized to access. The access control service 174 may also modify the email resources 165 before providing the client devices 120 with access to the email resources 165. In certain embodiments, the access control service 174 may add at least one uniform resource locator (URL) to the email resources 165 in accordance with at least one resource rule 171 associated with the email resources 165.

In one embodiment, the resource rules 171 may, for instance, specify that email resources 165 must contain certain information, such as information specifically related to enterprise policy, privacy policy, confidentiality policy and/or attorney-client privilege. The resource rules 171 may further specify that certain portions of the email resources 165 must contain certain information, such as the bodies, headers, footers, and/or attachments of the email resources 165. If a given email resource 165 does not contain the information required by an associated resource rule 171, the access control service 174 may modify the email resource 165 to comply with the resource rule 171 by adding at least one URL to the email resources 165. The URLs may, for example, provide access to at least one website that contains information that the email resources 165 are required to contain in accordance with the associated resource rules 171, such as information related to

21

enterprise policy, privacy policy, confidentiality policy and/or attorney-client privilege. Thus, the access control service 174 may supplement email resources 165 that do not contain information required by associated resource rules 171 by adding URLs that provide access to the required information at a remote location.

In another embodiment, the resource rules 171 may, for instance, specify that email resources 165 must contain certain URLs and/or other links that provide access to certain websites. The resource rules 171 may further specify that certain portions of the email resources 165 must contain certain URLs, such as the bodies, headers, footers, and/or attachments of the email resources 165. If the access control service 174 determines that the email resources 165 do not contain the required URLs, then the access control service 174 may add the required URLs to the email resources 165. Additionally, if the access control service 174 determines that the email resources 165 do not contain the required URLs but contain the same information that may be accessed via the URLs, then the access control service 174 may maintain the email resources 165 in their unaltered state. Alternatively, if the access control service 174 determines that the email resources 165 do not contain the required URLs but contain the same information that may be accessed via the URLs, the access control service 174 may, nevertheless, add the required URLs to the email resources 165 to further ensure that the email resources 165 are paired with the information required by the resource rules 171 associated with the email resources 165.

In certain embodiments, the resource rules 171 may further specify that the email resources 165 may only contain URLs that are configured in a specific manner. Accordingly, the access control service 174 may configure and/or modify the URLs before adding the URLs to the email resources 165. In one embodiment, the access control service 174 may configure the URLs to be exclusively accessible via at least one application on the client devices 120, such as the client side application 126 (FIG. 1). For example, the access control service 174 may configure the URLs to be exclusively accessible via a certain secure browser application, thereby preventing the URLs from being accessible via a native browser application.

In another embodiment, the access control service 174 may encrypt the URLs based at least in part on at least one cryptographic key, such that at least one cryptographic key is required to decrypt the URLs to access at least one website via the URLs. The access control service 174 may further couple the email resources 165 with the cryptographic keys needed to decrypt the URLs. One skilled in the art will recognize that either symmetric or asymmetric encryption may be employed to encrypt the URLs by the access control service 174, and that the access control service 174 may provide the client devices 120 with the appropriate decryption key based on the type of encryption used to encrypt the URLs. Accordingly, if the access control service 174 utilizes symmetric encryption, then the access control service 174 may pair the encrypted URLs with the key used to encrypt the URLs; on the contrary, if the access control service 174 utilizes asymmetric encryption, then the access control service 174 may pair the encrypted URLs with a decryption key corresponding to the encryption key used to encrypt such URLs.

In yet a further embodiment, the access control service 174 may configure the URLs by digitally signing the URLs based at least in part on at least one digital signature algorithm. The access control service 174 may further, for example, pair the digitally signed URLs with at least one digital signature algorithm that may confirm for the client devices 120 that the

22

URLs were signed by the access control service 174. In yet an even further embodiment, the access control service 174 may configure the URLs by encrypting the URLs based at least in part on at least one cryptographic key, digitally signing the URLs based at least in part on at least one digital signature algorithm, and pairing the encrypted URLs with the corresponding digitally signed URLs, which may assist the client devices 120 in verifying that the access control service 174 has configured the URLs. Additionally, the access control service 174 may further pair the URLs with both at least one decryption key capable of decrypting the encrypted URLs and at least one digital signature algorithm capable of confirming for the client devices 120 that the digitally signed URLs were configured by the access control service 174. Finally, the access control service 174 may instruct at least one email service 1202 and/or at least one client device 120 to add and/or configure at least one URL within at least one email resource 165 in the same manner described in the aforementioned embodiments.

Furthermore, the access control service 174 may be configured to provide the client devices 120 with access to the email services 1202 and/or the email resources 165 associated with the email services 1202. In one embodiment, the access control service 174 may be configured to transmit email resources 165 to the client devices 120. For example, the access control service 174 may establish a secure communicative connection with the client devices 120, such as HTTPS/SSL, through which the access control service 174 may transmit the email resources 165 associated with the email services 1202 to the client devices 120. In another embodiment, the access control service 174 may be configured to transmit instructions to the email services 1202 that specify that the email services 1202 should transmit the email resources 165 to the client devices 120. In any instance, the access control service 174 may provide the client devices 120 with access to email resources 120 that include URLs such as URLs specifically related to enterprise policy, privacy policy, confidentiality policy, or attorney-client privilege, URLs configured to be exclusively accessible via the client side application 126, encrypted URLs, decryption keys specific to the encrypted URLs, digitally signed URLs, digital signature algorithms specific to the digitally signed URLs, and/or the like.

FIG. 13 is a flowchart illustrating exemplary functionality performed by an access control service 174 executed by an access control server 150 (FIG. 1) according to certain embodiments. It is understood that the flowchart of FIG. 13 provides merely an example of the many different types of functional arrangements that may be employed to implement the operation of the access control service 174 as described herein. As an alternative, the flowchart of FIG. 13 may be viewed as depicting an example of steps of a method implemented in the access control server 150 according to at least one embodiment.

Beginning with step 1302, an access control service 174 may proxy at least one email resource 165 (FIG. 1) in transit to at least one client device 120 (FIG. 1) from at least one email service 1202 (FIG. 12). In one embodiment, the access control service 174 may be configured to proxy all data transmitted between the email services 1202 and the client devices 120. For example, the access control service 174 may identify email resources 165 in transit to the client devices 120 via the access control service 174 and may prohibit the email resources 165 from directly proceeding to the client devices 120. In another embodiment, the access control service 174 may be configured to act as a gateway that controls access to the email services 1202. For instance, the access control

23

service 174 may transmit instructions to the email services 1202 that specify that email resources 165 intended for the client devices 120 must be transmitted to the client devices 120 via the access control service 174.

Next, in step 1304, the access control service 174 may identify at least one resource rule 171 (FIG. 1) associated with the email resources 165. In certain embodiments, the access control service 174 may identify resource rules 171 that are associated with the email resources 165 by querying the data store 153 (FIG. 1) of the access control server 150 (FIG. 1) to identify a listing of associated email resources 165 and resource rules 171. In some embodiments, the access control service 174 may identify resource rules 171 that are associated with the email resources 165 by receiving an indication from the email services 1202 associated with the email resources 165 that specifies that certain email resources 165 are associated with certain resource rules 171. In other embodiments, the access control service 174 may identify metadata and/or other embedded instructions within the email resources 165 that specify which resource rules 171 are associated with the given email resources 165.

In any instance, the resource rules 171 may specify that the email resources 165 must include at least one URL. In certain embodiments, the resource rules 171 may require that the URLs be specifically related to one or more of enterprise policy, privacy policy, confidentiality policy, or attorney-client privilege. In some embodiments, the resource rules 171 may specify that the URLs must be configured to be exclusively accessible via at least one application on the client devices 120. In one embodiment, the resource rules 171 may specify that the URLs must be encrypted based at least in part on at least one cryptographic key. In another embodiment, the resource rules 171 may specify that the URLs must be digitally signed based at least in part on at least one digital signature algorithm. In yet another embodiment, the resource rules 171 may specify that the URLs must be encrypted based at least in part on at least one cryptographic key, that the URLs must be digitally signed based at least in part on at least one digital signature algorithm, and that the corresponding encrypted URLs and digitally signed URLs must be paired.

Then, in step 1306, the access control service 174 may add at least one URL to the email resources 165 in accordance with the resource rules 171. In certain embodiments, the access control service 174 may add URLs to the email resources 165 that are specifically related to one or more of enterprise policy, privacy policy, confidentiality policy, or attorney-client privilege. For example, the access control service 174 may add a URL to an email resource 165 to provide the client device 120 with access to a website that includes a listing of enterprise policies associated with the enterprise-owned client device 120. In some embodiments, the access control service 174 may add URLs that are configured to be exclusively accessible via at least one client device 120 application. For instance, the access control service 174 may add URLs that can only be accessed via secure browser applications such as the client side application 126, rather than the native browser applications on the client devices 120.

In one embodiment, the access control service 174 may add URLs to the email resources 165 that have been encrypted based at least in part on at least one cryptographic key. The access control service 174 may further, for instance, pair the email resources 165 with at least one cryptographic key capable of decrypting the URLs to provide the client devices 120 with access to the URLs. In another embodiment, the access control service 174 may add URLs to the email resources 165 that have been digitally signed based at least in part on at least one digital signature algorithm. The access

24

control service 174 may further, for example, pair the email resources 165 with at least one digital signature algorithm capable of verifying for the client devices 120 that the URLs were digitally signed by the access control service 174. In yet another embodiment, the access control service 174 may add a combination of encrypted URLs and digitally signed URLs to the email resources 165, as described herein, and may further pair the email resources 165 with the cryptographic keys and/or digital signature algorithms necessary to access and/or verify the authenticity of the URLs.

In certain embodiments, the access control service 174 may additionally authorize the client devices 120 to access the email resources 165. In one embodiment, the access control service 174 may be configured to transmit at least one email resource 165 to the client devices 120. For example, the access control service 174 may transmit email resources 165 with added URLs to the client devices 120. Additionally, the access control service 174 may transmit email resources 165 to the client devices 120 that include URLs specific to a certain client side application 126, encrypted URLs, decryption keys specific to the encrypted URLs, digitally signed URLs, and/or digital signature algorithms specific to the digitally signed URLs. In another embodiment, the access control service 174 may transmit instructions to at least one email service 1202 that specify that the email services 1202 may transmit email resources 165 with added URLs, configured URLs, and/or the like to the client devices 120. In yet another embodiment, the access control service 174 may transmit instructions to the client devices 120 that specify that the client devices 120 are authorized to access email resources 165 with added URLs, configured URLs, and/or the like.

FIG. 14 depicts certain illustrative components for a networked environment 1400 according to various embodiments. In certain embodiments, the networked environment 100 may include at least one network 110, at least one client device 120, an access control service 174, and at least one email service 1202. The networked environment 1400 may be similar to the networked environment 1200 in FIG. 12. While the networked environment 1200 may include the same components as the networked environment 1400, the organization of the components of the two networked environment may differ. In particular, the email services 1202 in the networked environment 1400 may communicate directly with the client devices 120, whereas the access control service 174 in the networked environment 1200 must relay all communications between the email services 1202 and the client devices 120. The access control service 174 of the networked environment 1400 may be configured to determine which email resources 165 associated with the email services 1202 may be accessed by the client devices 120, control the manner in which the client devices 120 are authorized to access the email resources 165, and may provide the client devices 120 with access to the email resources 165.

In certain embodiments, the access control service 174 may control which email resources 165 associated with the email services 1202 may be accessed by the client devices 120 by configuring the email services 1202 and/or at least one client side application 126 (FIG. 1) on the client devices 120. More specifically, the access control service 174 may transmit at least one instruction to the email services 1202 and/or client side applications 126 that configure the functionality of the email services 1202 and/or client side applications 126, respectively. As an example, the access control service 174 may utilize an instruction protocol, such as Microsoft PowerShell, to transmit the instructions to an email service 1202, such as Microsoft Exchange. Additionally, the access control service 174 may utilize protocols specific to the client side

25

applications 126 and/or client devices 120, such as an application programming interface (API), to transmit the instructions to the client side applications 126 and/or client devices 120. In some embodiments, the instructions may represent and/or specify at least one resource rule 171 (FIG. 1) that must be satisfied for the client devices 120 to be authorized to access the email resources 165.

In one embodiment, the resource rules 171 may specify that all email resources 165 must have certain URLs added before the email resources 165 may be provided to the client devices 120. The resource rules 171 may further specify, for instance, that certain portions of the email resources 165 must include certain URLs, such as the header, body, footer, and/or other portions of the email resources 165. Additionally, the resource rules 171 may specify that the email resources 165 only need URLs added if the email resources 165 do not, standing alone, contain information that may be accessed via the URLs, such as information specifically related to enterprise policy, privacy policy, confidentiality policy, and/or attorney-client privilege.

In another embodiment, the resource rules 171 may specify that URLs must be configured to be exclusively accessible via at least one application on the client devices 120 before the URLs are added to the email resources 165. For instance, the URLs may be configured to provide the client devices 120 with access to certain websites through a non-native, secure browser application, as opposed to the native browser applications of the client devices 120. In yet another embodiment, the resource rules 171 may specify that URLs must be encrypted based at least in part on at least one cryptographic key before the URLs are added to the email resources 165. In yet a further embodiment, the resource rules 171 may specify that URLs must be digitally signed based at least in part on at least one digital signature algorithm before the URLs are added to the email resources 165.

Furthermore, the access control service 174 may provide the client devices 120 with access to the email resources 165. In certain embodiments, the access control service 174 may transmit instructions to the email services 1202 and/or client side applications 126 on the client devices 120 that provide the client devices 120 with access to the email resources 165. In some embodiments, the access control service 174 may tailor the authorization instructions in accordance with at least one resource rule 171. For instance, the resource rules 171 may specify that the email resources 165 may only be transmitted from the email services 1202 to the client devices 120 over a secure connection, such as over an HTTPS/SSL connection. In other embodiments, the access control service 174 may tailor the authorization instructions to support at least one resource rule 171. If, for example, encrypted URLs have been added to the email resources 165 in accordance with the resource rules 171, then the access control service 174 may transmit instructions that specify that the email resources 165 must be paired with at least one cryptographic key capable of decrypting the URLs for the client devices 120. Similarly, if digitally signed URLs have been added to the email resources 165 in accordance with the resource rules 171, then the access control service 174 may transmit instructions that specify that the email resources 165 must be paired with at least one digital signature algorithm capable of verifying the authenticity of the email resources 165 and/or added URLs for the client devices 120. Furthermore, if both encrypted URLs and corresponding digitally signed URLs have been added to the email resources 165 in accordance with the resource rules 171, then the access control service 174 may transmit instructions that specify that the email resources 165 must be paired with a pairing of at least one

26

cryptographic key and at least one digital signature algorithm capable of providing the client devices 120 with access to email resources 165 whose source is verified, as described herein.

FIG. 15 is a flowchart illustrating exemplary functionality performed by a client side application 126 executed by a client device 120 (FIG. 1) according to certain embodiments. It is understood that the flowchart of FIG. 15 provides merely an example of the many different types of functional arrangements that may be employed to implement the operation of the client side application 126 as described herein. As an alternative, the flowchart of FIG. 15 may be viewed as depicting an example of steps of a method implemented in the client device 120 according to at least one embodiment. In any instance, the exemplary functionality of the client side application 126 may be triggered in response to instructions transmitted by an access control service 174 (FIG. 1) executed by an access control server 150 (FIG. 1), as previously disclosed in FIG. 14.

Beginning with step 1502, the client side application 126 may identify at least one email resource 165 (FIG. 1) on the client device 120. In certain embodiments, the client side application 126 may identify the email resources 165 by receiving the email resources 165 from an email service 1202 (FIG. 12) associated with the email resources 165. For example, the client side application 126 may receive the email resources 165 from a Microsoft Exchange email service 1202. In some embodiments, the client side application 126 may identify the email resources 165 by receiving the email resources 165 from an access control service 174 (FIG. 1) executed by an access control server 150 (FIG. 1). In any instance, the client side application 126 may identify email resources 165 accessible to the client device 120, such as email resources 165 stored in the data store 122 (FIG. 1) of the client device 120.

Next, in step 1504, the client side application 126 may identify at least one resource rule 171 (FIG. 1) associated with the email resources 165. In certain embodiments, the client side application 126 may identify resource rules 171 that are associated with the email resources 165 by querying the data store 153 (FIG. 1) of the access control server 150 (FIG. 1) and/or the data store 122 (FIG. 1) of the client device 120 to identify a listing of associated email resources 165 and resource rules 171. In some embodiments, the client side application 126 may identify resource rules 171 that are associated with the email resources 165 by receiving an indication from the email services 1202 associated with the email resources 165 that specifies that certain email resources 165 are associated with certain resource rules 171. In other embodiments, the client side application 126 may identify metadata and/or other embedded instructions within the email resources 165 that specify which resource rules 171 are associated with the given email resources 165.

In any instance, the resource rules 171 may specify that the email resources 165 must include at least one URL. In certain embodiments, the resource rules 171 may require that the URLs be specifically related to one or more of enterprise policy, privacy policy, confidentiality policy, or attorney-client privilege. In some embodiments, the resource rules 171 may specify that the URLs must be configured to be exclusively accessible via at least one application on the client devices 120. In one embodiment, the resource rules 171 may specify that the URLs must be encrypted based at least in part on at least one cryptographic key. In another embodiment, the resource rules 171 may specify that the URLs must be digitally signed based at least in part on at least one digital signature algorithm. In yet another embodiment, the resource

27

rules 171 may specify that the email resources 165 must contain a combination of encrypted URLs and digitally signed URLs, as described herein.

Then, in step 1506, the client side application 126 may add at least one URL to the email resources 165 in accordance with the resource rules 171. In certain embodiments, the client side application 126 may add URLs to certain portions of the email resources 165, such as the headers, footers, bodies, attachments and/or other portions of the email resources 165. In some embodiments, the client side application 126 may add URLs to the email resources 165 that are specifically related to one or more of enterprise policy, privacy policy, confidentiality policy, or attorney-client privilege. In other embodiments, the client side application 126 may add encrypted URLs, digitally signed URLs, and/or combinations of the like to the email resources 165, as described herein.

Furthermore, the client side application 126 may authorize the client device 120 to access the email resources 165. In certain embodiments, the client side application 126 may authorize the client device 120 to access at least one URL within the email resources 165, such as a URL added to the email resources 165 by the access control service 174 and/or the client side application 126. In embodiments where the URLs and/or the email resources 165 are configured to be exclusively accessible via at least one application on the client device 120, the client side application 126 may determine whether it may access the email resources 165. If the client side application 126 determines that it is not capable of accessing the email resources 165, then the client side application 126 may call on another application on the client device 120 that is capable of accessing the email resources 165. Thus, the client device 120 may access URLs and/or email resources 165 that have been configured to be exclusively accessible via certain applications by launching those certain applications to access the URLs and/or email resources 165.

In some embodiments, the client side application 126 may provide the client device 120 with access to at least one URL that has been encrypted by at least one cryptographic key. The client side application 126 may utilize at least one cryptographic key to decrypt the encrypted URLs and provide the client device 120 with access to the URLs. In one embodiment, the client side application 126 may, for example, receive the cryptographic keys from at least one access control service 174 and/or email service 1202 associated with the email resources 165. In another embodiment, the client side application 126 may request the cryptographic keys from at least one access control service 174 and/or email service 1202 associated with the email resources 165. In yet another embodiment, the client side application 126 may obtain the cryptographic keys from the data store 122 of the client device 120.

In other embodiments, the client side application 126 may verify for the client device 120 that at least one URL that has been digitally signed by at least one digital signature algorithm was sent by an authentic sender. For instance, the client side application 126 may determine whether the digitally signed URL was created by at least one access control service 174 and/or email service 1202 associated with the email resources 165.

In one embodiment, the client side application 126 may, for example, receive the digital signature algorithms from at least one access control service 174 and/or email service 1202 associated with the email resources 165. In another embodiment, the client side application 126 may request the digital signature algorithms from at least one access control service

28

174 and/or email service 1202 associated with the email resources 165. In yet another embodiment, the client side application 126 may obtain the digital signature algorithms from the data store 122 of the client device 120.

In any instance, the client side application 126 may provide the client device 120 with access to the email resources 165 by rendering at least one user interface 137 (FIG. 1) on at least one display 136 (FIG. 1) of the client device 120 and presenting the email resources 165 on the user interfaces 137. In certain embodiments, the client side application 126 may launch the URLs within the email resources 165 to provide the client device 120 with access to information on the user interfaces 137, such as information that is not contained within the email resources 165 themselves. The URLs may, for instance, launch websites on the user interfaces 137 that include information specifically related to at least one of enterprise policy, privacy policy, confidentiality policy, and/or attorney-client privilege.

FIG. 16 is a flowchart illustrating exemplary functionality performed by at least one access control service 174 executed by at least one access control server 150 and/or at least one client side application 126 executed by at least one client device 120 (FIG. 1) according to certain embodiments. It is understood that the flowchart of FIG. 16 provides merely an example of the many different types of functional arrangements that may be employed to implement the operation of the access control service 174 and/or the client side application 126 as described herein. As an alternative, the flowchart of FIG. 16 may be viewed as depicting an example of steps of a method implemented in the access control server 150 and/or the client device 120 according to at least one embodiment.

Beginning with step 1602, the access control service 174 and/or client side application 126 may identify at least one email resource 165 (FIG. 1). In certain embodiments, the access control service 174 and/or client side application 126 may identify the email resources 165 by receiving the email resources 165 from an email service 1202 (FIG. 12) associated with the email resources 165. For example, the access control service 174 and/or client side application 126 may receive the email resources 165 from a Microsoft Exchange email service 1202. In some embodiments, the client side application 126 may identify the email resources 165 by receiving the email resources 165 from the access control service 174. In other embodiments, the access control service 174 and/or client side application 126 may query the data store 153 (FIG. 1) of the access control server 150 and/or the data store 122 (FIG. 1) of the client device 120 to determine whether the data stores hold email resources 165.

Next, in step 1604, the access control service 174 and/or client side application 126 may identify at least one resource rule 171 (FIG. 1) associated with the email resources 165. In certain embodiments, the access control service 174 and/or client side application 126 may identify resource rules 171 that are associated with the email resources 165 by querying the data store 153 (FIG. 1) of the access control server 150 (FIG. 1) and/or the data store 122 (FIG. 1) of the client device 120 to identify a listing of associated email resources 165 and resource rules 171. In some embodiments, the access control service 174 and/or client side application 126 may identify resource rules 171 that are associated with the email resources 165 by receiving an indication from the email services 1202 associated with the email resources 165 that specifies that certain email resources 165 are associated with certain resource rules 171. In other embodiments, the access control service 174 and/or client side application 126 may identify metadata and/or other embedded instructions within

the email resources **165** that specify which resource rules **171** are associated with the given email resources **165**.

In any instance, the resource rules **171** may specify that the email resources **165** must include at least one component. In certain embodiments, the components may include text within the email resources **165** and/or file attachments to the email resources **165**. In some embodiments, the components may include URLs within the email resources **165**, which may provide access to webpages containing data such as text and/or files.

In certain embodiments, the resource rules **171** may require that the URLs be specifically related to one or more of enterprise policy, privacy policy, confidentiality policy, or attorney-client privilege. In some embodiments, the resource rules **171** may specify that the URLs must be configured to be exclusively accessible via at least one application on the client devices **120**. In one embodiment, the resource rules **171** may specify that the URLs must be encrypted based at least in part on at least one cryptographic key. In another embodiment, the resource rules **171** may specify that the URLs must be digitally signed based at least in part on at least one digital signature algorithm. In yet another embodiment, the resource rules **171** may specify that the email resources **165** must contain a combination of encrypted URLs and digitally signed URLs, as described herein.

Then, in step **1606**, the access control service **174** and/or client side application **126** may add at least one URL to the email resources **165** in accordance with the resource rules **171**. In certain embodiments, the access control service **174** and/or client side application **126** may add URLs to certain portions of the email resources **165**, such as the headers, footers, bodies, attachments and/or other portions of the email resources **165**. In some embodiments, the access control service **174** and/or client side application **126** may add URLs to the email resources **165** that are specifically related to one or more of enterprise policy, privacy policy, confidentiality policy, or attorney-client privilege. In other embodiments, the access control service **174** and/or client side application **126** may add encrypted URLs, digitally signed URLs, and/or combinations of the like to the email resources **165**, as described herein.

Moreover, the access control service **174** and/or client side application **126** may authorize at least one client device **120** to access the email resources **165**, including any URLs within the email resources **165**, as described herein.

FIG. 17 shows schematic block diagrams of an exemplary access control server **150** and an exemplary client device **120** according to an embodiment of the present disclosure. The access control server **150** includes at least one processor circuit, for example, having a processor **1703** and a memory **1706**, both of which are coupled to a local interface **1709**. To this end, the access control server **150** may comprise, for example, at least one server computer or like device. Similarly, the client device **120** includes at least one processor circuit, for example, having a processor **1753** and a memory **1756**, both of which are coupled to a local interface **1759**. Additionally, the client device **120** may be in data communication with a display **136** for rendering user interfaces **137** (FIG. 1) and at least one other I/O devices **1763** for inputting and outputting data. To this end, the client device **120** may comprise, for example, at least one client computer or like device.

The following is a general discussion of the components of the access control server **150** and the client device **120**. The local interface **1709** and **1759** may comprise, for example, a data bus with an accompanying address/control bus or other bus structure as can be appreciated. Stored in the memory

1706 and **1756** are both data and several components that are executable by the processors **1703** and **1753**. In particular, with regard to the access control server **150**, stored in the memory **1706** and executable by the processor **1703** are an access control service **174** and potentially other applications. Additionally, with regard to the client device **120**, stored in the memory **1756** and executable by the processor **1753** are a client side application **126** and potentially other applications. Also stored in the memory **1706** and **1756** may be a data store **153** and **122** and other data. In addition, an operating system may be stored in the memory **1706** and **1756** and executable by the processor **1703** and **1753**.

It is to be understood that there may be other applications that are stored in the memory **1706** and **1756** and are executable by the processor **1703** and **1753** as can be appreciated. Where any component discussed herein is implemented in the form of software, any one of a number of programming languages may be employed such as, for example, C, C++, C#, Objective C, Java, JavaScript, Perl, PHP, Visual Basic, Python, Ruby, Delphi, Flash, or other programming languages.

A number of software components are stored in the memory **1706** and **1756** and are executable by the processor **1703** and **1753**. In this respect, the term “executable” means a program file that is in a form that can ultimately be run by the processor **1703** and **1753**. Examples of executable programs may be, for example, a compiled program that can be translated into machine code in a format that can be loaded into a random access portion of the memory **1706** and **1756** and run by the processor **1703** and **1753**, source code that may be expressed in proper format such as object code that is capable of being loaded into a random access portion of the memory **1706** and **1756** and executed by the processor **1703** and **1753**, or source code that may be interpreted by another executable program to generate instructions in a random access portion of the memory **1706** and **1756** to be executed by the processor **1703** and **1753**, etc. An executable program may be stored in any portion or component of the memory **1706** and **1756** including, for example, random access memory (RAM), read-only memory (ROM), hard drive, solid-state drive, USB flash drive, memory card, optical disc such as compact disc (CD) or digital versatile disc (DVD), floppy disk, magnetic tape, or other memory components.

The memory **1706** and **1756** are defined herein as including both volatile and nonvolatile memory and data storage components. Volatile components are those that do not retain data values upon loss of power. Nonvolatile components are those that retain data upon a loss of power. Thus, the memory **1706** and **1756** may comprise, for example, random access memory (RAM), read-only memory (ROM), hard disk drives, solid-state drives, USB flash drives, memory cards accessed via a memory card reader, floppy disks accessed via an associated floppy disk drive, optical discs accessed via an optical disc drive, magnetic tapes accessed via an appropriate tape drive, and/or other memory components, or a combination of any two or more of these memory components. In addition, the RAM may comprise, for example, static random access memory (SRAM), dynamic random access memory (DRAM), or magnetic random access memory (MRAM) and other such devices. The ROM may comprise, for example, a programmable read-only memory (PROM), an erasable programmable read-only memory (EPROM), an electrically erasable programmable read-only memory (EEPROM), or other like memory device.

Also, the processor **1703** and **1753** may represent multiple processors, and the memory **1706** and **1756** may represent multiple memories that operate in parallel processing cir-

31

cuits, respectively. In such a case, the local interface **1709** and **1759** may be an appropriate network **110** (FIG. **1**) that facilitates communication between any two of the multiple processors **1703** and **1753**, or between any two of the memory **1706** and **1756**, etc. The local interface **1709** and **1759** may comprise additional systems designed to coordinate this communication, including, for example, performing load balancing. The processor **1703** and **1753** may be of electrical or of some other available construction.

Although the access control service **174**, client side application **126**, and other various systems described herein may be embodied in software or code executed by general purpose hardware as discussed above, as an alternative the same may also be embodied in dedicated hardware or a combination of software/general purpose hardware and dedicated hardware. If embodied in dedicated hardware, each can be implemented as a circuit or state machine that employs any one of or a combination of a number of technologies. These technologies may include, but are not limited to, discrete logic circuits having logic gates for implementing various logic functions upon an application of at least one data signals, application specific integrated circuits having appropriate logic gates, or other components, etc. Such technologies are generally well known by those skilled in the art and, consequently, are not described in detail herein.

The flowcharts of FIGS. **2**, **3**, **13**, **15** and **16** show certain functionality and operations performed by the access control service **174** and client side application **126**, respectively. If embodied in software, each box may represent a module, segment, or portion of code that comprises program instructions to implement the specified logical function(s). The program instructions may be embodied in the form of source code that comprises human-readable statements written in a programming language or machine code that comprises numerical instructions recognizable by a suitable execution system such as a processor **1703** and **1753** in a computer system or other system. The machine code may be converted from the source code, etc. If embodied in hardware, each block may represent a circuit or a number of interconnected circuits to implement the specified logical function(s).

Although the flowcharts of FIGS. **2**, **3**, **13**, **15** and **16** show a specific order of execution, it is understood that the order of execution may differ from that which is depicted. For example, the order of execution of two or more steps may be scrambled relative to the order shown. Also, two or more blocks shown in succession in FIGS. **2**, **3**, **13**, **15**, and **16** may be executed concurrently or with partial concurrence. Further, in some embodiments, at least one of the steps shown in FIGS. **2**, **3**, **13**, **15** and **16** may be skipped or omitted. In addition, any number of counters, state variables, warning semaphores, or messages might be added to the logical flow described herein, for purposes of enhanced utility, accounting, performance measurement, or providing troubleshooting aids, etc. It is understood that all such variations are within the scope of the present disclosure.

Also, any logic or application described herein, including the access control service **174** and the client side application **126**, that comprises software or code can be embodied in any non-transitory computer-readable medium for use by or in connection with an instruction execution system such as, for example, a processor **1703** and **1753** in a computer system or other system. In this sense, the logic may comprise, for example, statements including instructions and declarations that can be fetched from the computer-readable medium and executed by the instruction execution system. In the context of the present disclosure, a "computer-readable medium" can be any medium that can contain, store, or maintain the logic or

32

application described herein for use by or in connection with the instruction execution system. The computer-readable medium can comprise any one of many physical media such as, for example, magnetic, optical, or semiconductor media. More specific examples of a suitable computer-readable medium would include, but are not limited to, magnetic tapes, magnetic floppy diskettes, magnetic hard drives, memory cards, solid-state drives, USB flash drives, or optical discs. Also, the computer-readable medium may be a random access memory (RAM) including, for example, static random access memory (SRAM) and dynamic random access memory (DRAM), or magnetic random access memory (MRAM). In addition, the computer-readable medium may be a read-only memory (ROM), a programmable read-only memory (PROM), an erasable programmable read-only memory (EPROM), an electrically erasable programmable read-only memory (EEPROM), or other type of memory device.

It should be emphasized that the above-described embodiments of the present disclosure are merely possible examples of implementations set forth for a clear understanding of the principles of the disclosure. Many variations and modifications may be made to the above-described embodiment(s) without departing substantially from the spirit and principles of the disclosure. All such modifications and variations are intended to be included herein within the scope of this disclosure and protected by the following claims.

The claimed invention is:

1. A non-transitory computer-readable medium embodying a program executable in at least one computing device comprising at least one hardware processor, the program comprising code that, when executed by the at least one computing device, causes the at least one computing device to:

- access an email resource requested by a client device from at least one email service;
- identify a resource rule specifying a condition for which the client device is authorized to access the email resource, the resource rule being identified based at least in part on a device state of the client device;
- determine whether the email resource satisfies the resource rule based at least in part on a stringency level associated with the resource rule, the stringency level being increased or reduced based at least in part on the device state;
- responsive to the email resource failing to satisfy the resource rule, modify the email resource causing the email resource to satisfy the resource rule; and
- responsive to the email resource, as modified, satisfying the resource rule, authorize the client device to access the email resource.

2. The non-transitory computer-readable medium of claim **1**, wherein the code that modifies the email resource to satisfy the resource rule further comprises code that formats the email resource from a current format of the email resource into hypertext markup language (HTML) format, rich text format, or plain text format.

3. The non-transitory computer-readable medium of claim **1**, wherein the code that modifies the email resource to satisfy the resource rule further comprises code that encodes the email resource using advanced encryption standard (AES) or data encryption standard (DES).

4. The non-transitory computer-readable medium of claim **1**, wherein the code that modifies the email resource to satisfy the resource rule further comprises code that configures the email resource to be exclusively accessible via at least one secure container application executable by the client device.

33

5. The non-transitory computer-readable medium of claim 1, wherein the code that modifies the email resource to satisfy the resource rule further comprises code that:

- removes an attachment associated with the email resource; encrypts the attachment based at least in part on a cryptographic key; and
- makes the attachment as encrypted available via a client application executable by the client device.

6. The non-transitory computer-readable medium of claim 1, wherein the code that modifies the email resource to satisfy the resource rule further comprises code that removes a digital image from a body of the email resource and attaches the digital image as an attachment to the email resource.

7. The non-transitory computer-readable medium of claim 1, wherein the code that modifies the email resource to satisfy the resource rule further comprises code that:

- flags the email resource as having been modified; and
- attaches an indication to the email resource that provides information associated with a modification of the email resource.

8. The non-transitory computer-readable medium of claim 1, wherein the code that authorizes the client device to access the email resource further comprises code that:

- transmits the email resource to the client device responsive to modifying the email resource to satisfy the resource rule;
- makes the email resource available for a download by the client device; or
- transmits the email resource to the client device upon receiving a request to download the email resource from the client device.

9. The non-transitory computer-readable medium of claim 1, wherein the device state further comprises information associated with a current time associated with the client device, at least one network accessible by the client device, or at least one network beacon accessible by the client device.

10. The non-transitory computer-readable medium of claim 1, wherein the device state further comprises information associated with a hardware feature of the client device, a software feature of the client device, or an application accessible by the client device.

11. The non-transitory computer-readable medium of claim 1, wherein the resource rule further comprises a variably stringent resource rule, wherein a stringency of the variably stringent resource rule is based at least in part on the device state associated with the client device.

12. A system, comprising:

- a first computing device comprising at least one hardware processor; and

program code executed in the first computing device that causes the first computing device to at least:

- proxy a second computing device to access an email resource requested by a client device from an email service;

identify a resource rule specifying a condition for which the client device is authorized to access the email resource, the resource rule being identified based at least in part on a device state associated with the client device;

determine whether the email resource satisfies the resource rule based at least in part on a stringency level associated with the resource rule, the stringency level being increased or reduced based at least in part on the device state;

responsive to the email resource failing to satisfy the resource rule, modify the email resource to satisfy the resource rule; and

34

responsive to the email resource satisfying the resource rule, authorize the client device to access the email resource.

13. The system of claim 12, wherein the program code that causes the first computing device to modify the email resource to satisfy the resource rule further comprises program code that causes the first computing device to add at least one uniform resource locator (URL) to the email resource responsive to the at least one URL being required by the resource rule.

14. The system of claim 12, wherein the program code that causes the first computing device to modify the email resource to satisfy the resource rule further comprises program code that causes the first computing device to encode the email resource using advanced encryption standard (AES) or data encryption standard (DES).

15. The system of claim 12, wherein the program code that causes the first computing device to modify the email resource to satisfy the resource rule further comprises program code that causes the first computing device to configure the email resource to be exclusively accessible via at least one secure container application executable by the client device.

16. The system of claim 12, wherein the program code that causes the first computing device to modify the email resource to satisfy the resource rule further comprises program code that causes the first computing device to at least: remove an attachment associated with the email resource; encrypt the attachment based at least in part on a cryptographic key; and make the attachment as encrypted available via a client application executable by the client device.

17. The system of claim 12, wherein the program code that causes the first computing device to modify the email resource to satisfy the resource rule further comprises program code that causes the first computing device to remove a digital image from a body of the email resource and attaches the digital image as an attachment to the email resource.

18. The system of claim 12, wherein the program code that causes the first computing device to modify the email resource to satisfy the resource rule further comprises program code that causes the first computing device to at least: flag the email resource as having been modified; and attach an indication to the email resource that provides information associated with a modification of the email resource.

19. The system of claim 12, wherein the device state further comprises information associated with a current time associated with the client device, at least one network accessible by the client device, or at least one network beacon accessible by the client device.

20. The system of claim 12, wherein the device state further comprises information associated with a hardware feature of the client device, a software feature of the client device, or an application accessible by the client device.

21. The system of claim 12, wherein the resource rule further comprises a variably stringent resource rule, wherein a stringency of the variably stringent resource rule is based at least in part on the device state associated with the client device.

22. A method, comprising:

- accessing, by a first computing device comprising at least one hardware processor, an email resource from a second computing device, the email resource being requested by a client device from an email service;

identifying, by the first computing device, a resource rule specifying a condition for which the client device is authorized to access the email resource, the resource rule

35

being identified based at least in part on a device state associated with the client device;
 determining, by the first computing device, whether the email resource satisfies the resource rule based at least in part on a stringency level associated with the resource rule, the stringency level being increased or reduced based at least in part on the device state;
 responsive to the email resource failing to satisfy the resource rule, modifying, by the first computing device, the email resource to satisfy the resource rule; and
 responsive to the email resource satisfying the resource rule, authorizing, by the first computing device, the client device to access the email resource.

23. The method of claim 22, wherein modifying the email resource to satisfy the resource rule further comprises adding, by the first computing device, at least one uniform resource locator (URL) to the email resource responsive to the at least one URL being required by the resource rule.

24. The method of claim 22, wherein modifying the email resource to satisfy the resource rule further comprises encoding, by the first computing device, the email resource using advanced encryption standard (AES) or data encryption standard (DES).

25. The method of claim 22, wherein modifying the email resource to satisfy the resource rule further comprises configuring, by the first computing device, the email resource to be exclusively accessible via at least one secure container application executable by the client device.

26. The method of claim 22, wherein modifying the email resource to satisfy the resource rule further comprises: removing, by the first computing device, an attachment associated with the email resource;

36

encrypting, by the first computing device, the attachment based at least in part on a cryptographic key; and making, by the first computing device, the attachment as encrypted available via a client application executable by the client device.

27. The method of claim 22, wherein modifying the email resource to satisfy the resource rule further comprises removing, by the first computing device, a digital image from a body of the email resource and attaching, by the first computing device, the digital image as an attachment to the email resource.

28. The method of claim 22, wherein modifying the email resource to satisfy the resource rule further comprises:

flagging, by the first computing device, the email resource as having been modified; and

attaching, by the first computing device, an indication to the email resource that provides information associated with a modification of the email resource.

29. The method of claim 22, wherein the device state further comprises information associated with a current time associated with the client device, at least one network accessible by the client device, or at least one network beacon accessible by the client device.

30. The method of claim 22, wherein the device state further comprises information associated with a hardware feature of the client device, a software feature of the client device, or an application accessible by the client device.

31. The method of claim 22, wherein the resource rule further comprises a variably stringent resource rule, wherein a stringency of the variably stringent resource rule is based at least in part on the device state associated with the client device.

* * * * *
